MUSHROOM GROW KIT READY-TO-GROW – MANUAL

EN This cultivation kit contains a box with colonized substrate (growth medium), a grow bag with an air filter and two paper clips. Requires minimum care once set up. All you need to do is harvest the mushrooms and water the box for the next cycle.

1. WATER

Carefully open one corner of the lid of the box. Gently turn on the tap and let the box fill up with water. Make sure the substrate is fully submerged. Close the lid again and let the box stand for 12 hours.

2. LET THE EXCESS WATER RUN OFF

After 12 hours, carefully open one corner of the lid and let all the excess water run off.

3. GROWTH

Wash your hands, remove the lid and place the box inside the grow bag. Fold the top of the bag and attach the paper clips to keep it closed. Do not throw the lid away, clean it and store it. You will need it again later on.

Put the grow kit in a warm spot (20-25°C) in the light, but not in the sun or above a radiator. Temperatures of around 25°C will allow for faster growth of the mushrooms. Leave the bag closed and the first mushrooms will appear in 14 days. These will mature in about 7 days.

4. HARVESTING

Mushrooms do not appear continuously but in so called 'flushes'. Preferably pick them when the veil on the underside of the cap begins to torn. If you wait too long, the caps will open and the mushrooms will drop their spores. These will colour the mushrooms and the inside of the bag black/purple. This is just a cosmetic problem however. Pick all mushrooms at once, except when one or two are growing much faster than their brothers (*). Small mushrooms between the substrate and the side of the box are best left undisturbed.

5. NEXT FLUSH

Immediately after harvesting, the box needs to be watered again for the next flush. Remove all mushrooms that failed to grow out, but try to keep the substrate intact. Put the lid back on the box, water it again and let the water run off after 12 hours. Put the box back in the bag and close it.

The cycle of watering, growing and harvesting can be repeated until the substrate is depleted. Often this is after four to five flushes, with the second flush generally giving the best results.

TIPS

(*) Before harvesting, carefully wash your hands with soap. Open the bag and take out the box. Harvest the mushrooms by grabbing the stem at the base and perform a twisting motion while lifting it upwards, out of the substrate. Touch the substrate as little as possible.
